SPS Pharma: Who we are?

- CRO offering all analytical services.
- Since 2005, only company in the world specialized in R&D for dissolution and release testing.
- Located in Orleans, 1h South of Paris (France).
- Facility fully cGMP compliant, US FDA inspected, regularly subject to audits.
- 30% of clients in North Am, 40% in Europe and 30% in Asia.

www.sps-pharma.com

SPS
Pharma Services

2

R&D services

- Dissolution feasibility studies (ie innovative dosage forms)
- Dissolution method developments
- Dissolution method transfers to automation
- Content testing method transfer on automated platforms
- Analytical methods development (HPLC/ UPLC & UV)
- Troubleshooting/ investigations/ consulting (failed BE, IVIVC, manufacturing..)

www.sps-pharma.com

SPS
Pharma Services
3

Routine analytical services

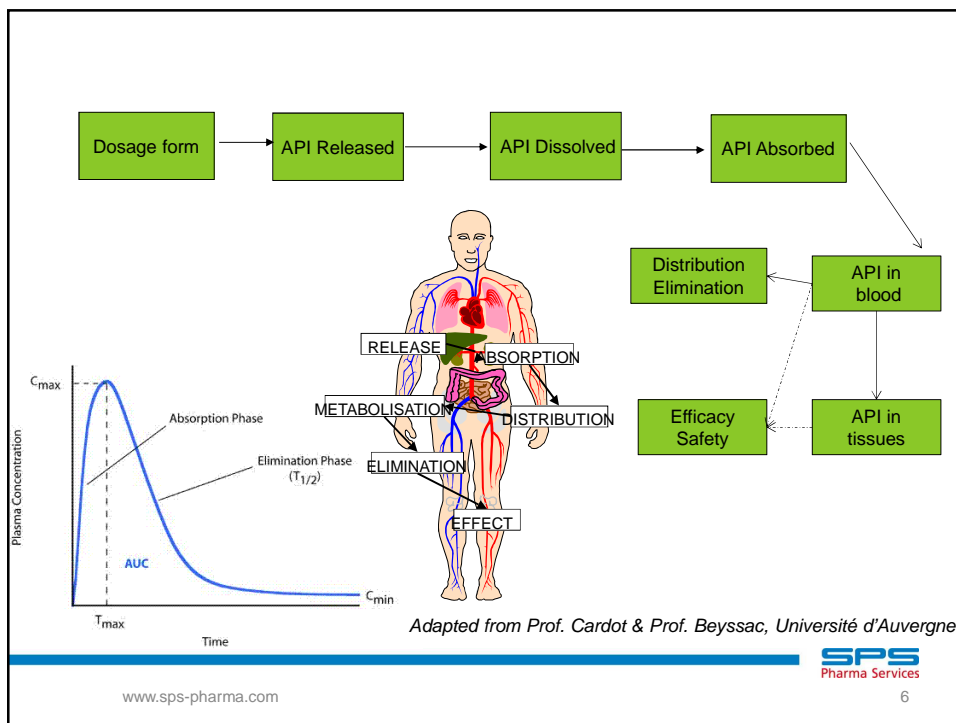

- Method validations
- QA/QC analysis (GMP)
- Stability studies (including samples storage)
- Dissolution (all compendia techniques)
- Automated dissolution
- Automated content
- Loss on drying
- Crushing force
- Friability
- Disintegration

Outline

- Introduction about flow through cell dissolution
- API characterization
 - Intrinsic dissolution rate
 - Apparent dissolution
 - Case studies
- Conclusion

$$\frac{dW}{dt} = \frac{D}{h} S(C_s - C_b)$$

Where

dW/dt = dissolution rate

D = diffusion coefficient

h = thickness of the stagnant layer surrounding the dissolving particle

S = the surface area of the solid

C_s = the concentration of a saturated solution

C_b = the concentration at any given time of the bulk solution

In the early 70's

* Only recently we discovered some documents which indicate that about 20 years ago the column method was favoured by the FDA and also considered by USP, for the release from timed-release preparations: a letter dated Aug. 23, 1957, from E.B. Vliet to the members of a Subcommittee on Tablets and a paper by D. J. Campbell and J. G. Theivagt in Drug Standards, 26, 73 (1958).

Extract from „Dissolution rate testing with the method column;Methodology and results“ F.Langensbucher, H.Rettig, 1977

Sotax following request from Dr Langenbucher in Ciba in the 70's...

...developed and...

Während die gleichförmige Drehbewegung beschreibt die Drehfrequenz in der zweiten Projektion eine gleichmäßige Kreisbewegung

$$\begin{cases} x = R \cdot \sin \varphi \\ y = R \cdot \cos \varphi \end{cases}$$

In der schiefen Benützungsbewegung ergibt sich eine in der x-Richtung gestreckte Ellipse mit den Halbachsen

$$\begin{cases} \xi = x/\cos \alpha = R \cdot \sin \varphi / \cos \alpha \\ \eta = y = R \cdot \cos \varphi \end{cases}$$

Q sei ein Bewegungspunkt in der Benützungsbewegung, die mit konstantem Winkelgeschwindigkeit $\dot{\varphi}$ verläuft und bei $\varphi = 0$ mit P zusammenfällt. $r = \overline{PQ}$ sei die Distanz zwischen beiden Punkten und β der Winkel zwischen der Winkelgeschwindigkeit und dem veränderlichen Abstand \overline{PQ} :

$$r = \xi - x = \frac{\xi}{\cos \alpha} - x = x \left(\frac{1}{\cos \alpha} - 1 \right) = R \left(\frac{1}{\cos \alpha} - 1 \right) \sin \varphi$$

Why choose USP4?

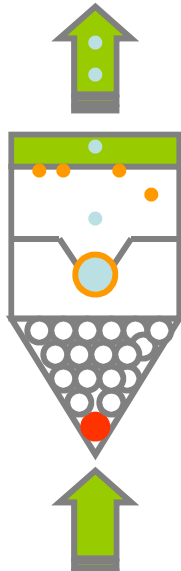

- USP 4 is the method of choice for **poorly soluble compounds** in order to maintain sink conditions
- USP 4 is a **compendial method for low volume** dissolution media
- Specific cells for special/novel dosage forms are available
- **Automated pH changes** can be easily achieved for IVIVC studies
- Solves many challenges of USP 2 such as floating or sticking products, and inherent sampling issues
- USP 4 method is increasingly used for measuring **API characterization** (apparent dissolution in Eur. Ph. § 2.9.43).
- USP 4 is a recommended method for **injectable suspensions**.

12

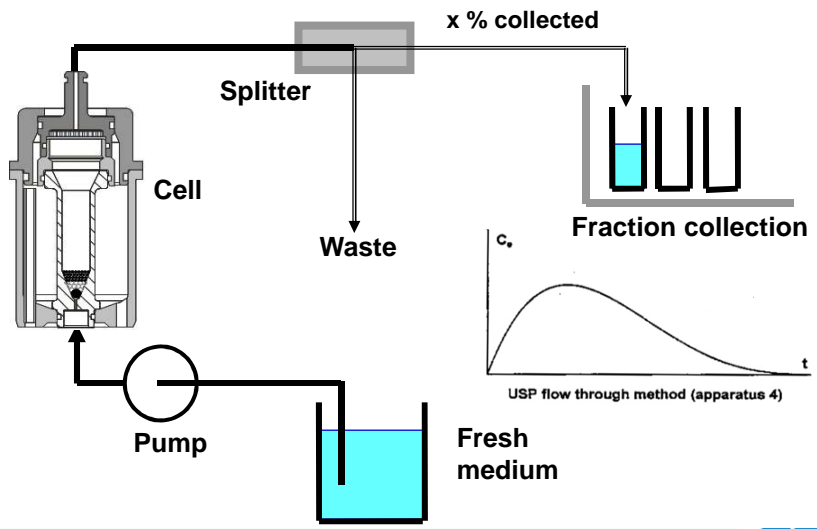

The Flow Through Cell

- The test sample is located in a small-volume cell through which solvent passes
- The eluate is filtered upon leaving the cell
- The eluate is analyzed directly (on-line) with a spectrophotometer and/or collected in a fraction collector (off-line).

Disintegration → cohesive properties of the formulation
 Release → type and proportion of excipients
 Dissolution of the drug → API characteristics

Importance of all steps in dissolution test interpretation

Outline

- Introduction about dissolution
- API characterization
 - Intrinsic dissolution rate
 - Apparent dissolution
 - Case studies
- Conclusion

Intrinsic dissolution (1)

The intrinsic dissolution rate is the rate of dissolution of pure pharmaceutical ingredients when conditions such as agitation or stirring speed, pH and ionic strength of the dissolution medium and surface area are held constant .

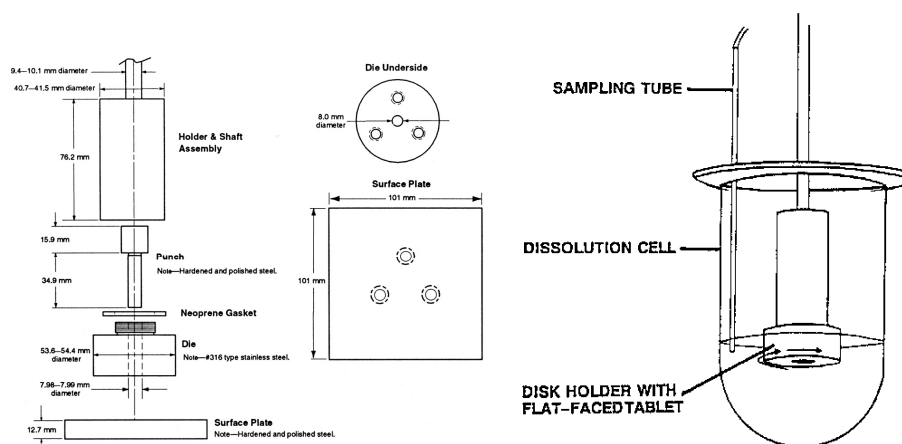

Physical properties effects are minimized or eliminated.

- Determination of the constant k
- Use of a tablet of pure drug
- Expressed as mg/min/cm²

$$\frac{dW}{dt} = \frac{D}{h} S(C_{\text{sat}} - C_t)$$

Eur. Ph. § 2.9.29

26

Apparent dissolution (1)

Dissolution studies when applied to powders allow :

- To optimize formulation variables, including particle size.
- To compare batches of active ingredient having different physical properties: surface area and particle size distribution.

The comparison of various polymorphic forms of drug substances can show identical or very different biopharmaceutical properties.

Particle morphology and identification !

What is the added value....

- Deformulation based on a RLD product
- Evaluate the physical properties of API (comparison of sources, etc...)
- Manufacturing troubleshooting (process issues, etc...)
- Many other possibilities...

Outline

- Introduction about dissolution
- API characterization
 - Intrinsic dissolution rate
 - Apparent dissolution
 - Case studies : IR tablets
- Conclusion

Case study: IR tablets

Product already marketed

Developed more than 20 years ago

Class I drug: soluble and good permeation

Background

A paddle dissolution method is in place and validated for QC purposes.

- Paddle 50rpm
- 500mL of HCl 0.1N
- UV online

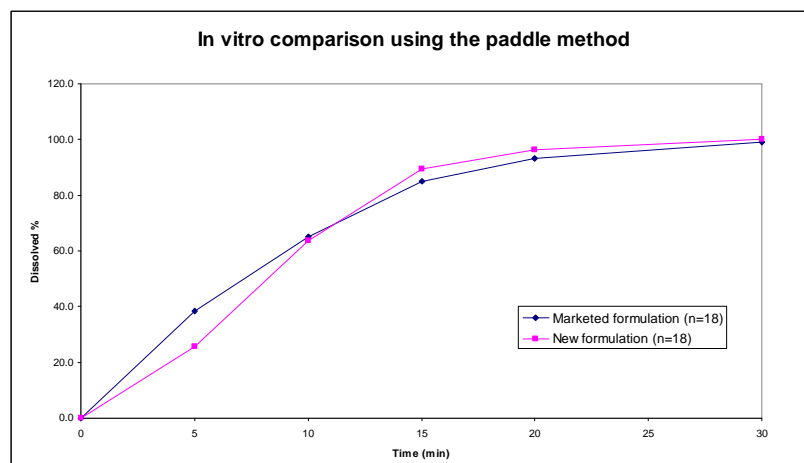

Changes:

- new API supplier
- slightly different quantitative formulation

Both formulations had been tested with the existing paddle method

→ In vitro equivalence demonstrated

Background

Background

Based on those data, the bioequivalence study was initiated:

- Male and female subjects
- 24 healthy volunteers
- fasted conditions

Results showed **in-equivalence** between both formulations.

Background

Hypothesis

API ?

- Intrinsic dissolution rate
- Apparent dissolution

Formulation ?

- Change the dissolution medium
- Change the dissolution technique

Manufacturing process ?

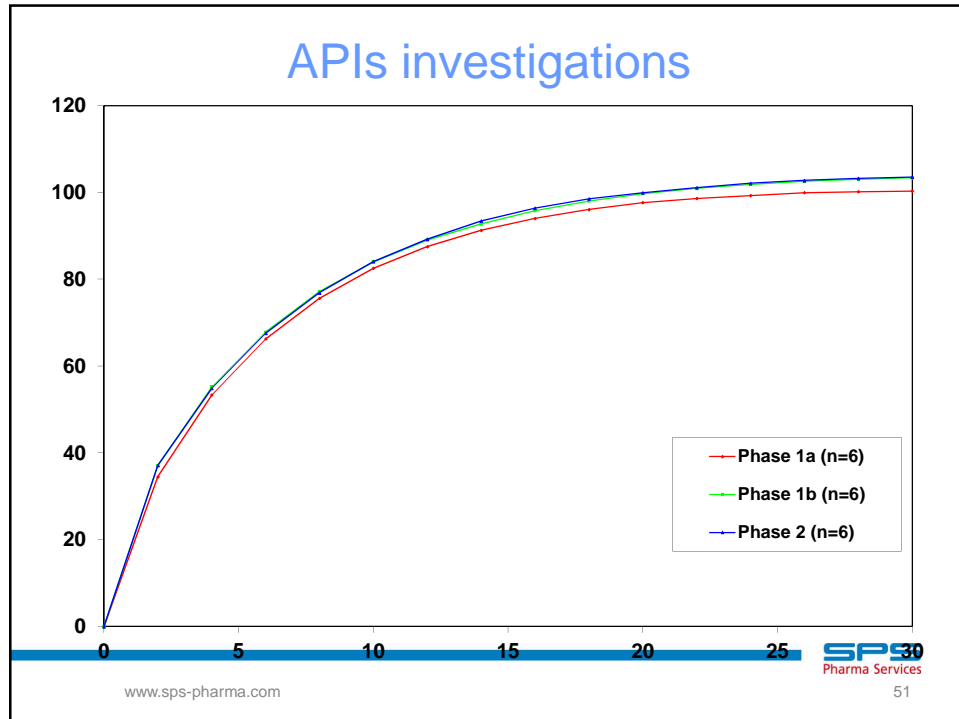

- Evaluate the product at each step of the process

APIs investigations

No polymorph (or pseudo-polymorph) known for this drug
→ no need to go for **intrinsic dissolution rate**.

Apparent dissolution using USP4 flow through cell with the specific powder cell according to EP chapter 2.9.43

Starting from the existing paddle method, a USP4 was developed using a closed system with the same dissolution medium and the same UV quantification method.

API investigations: conclusion

- No difference showed by this technique between both APIs.
- Remaining options: Formulation or manufacturing process

www.sps-pharma.com  52

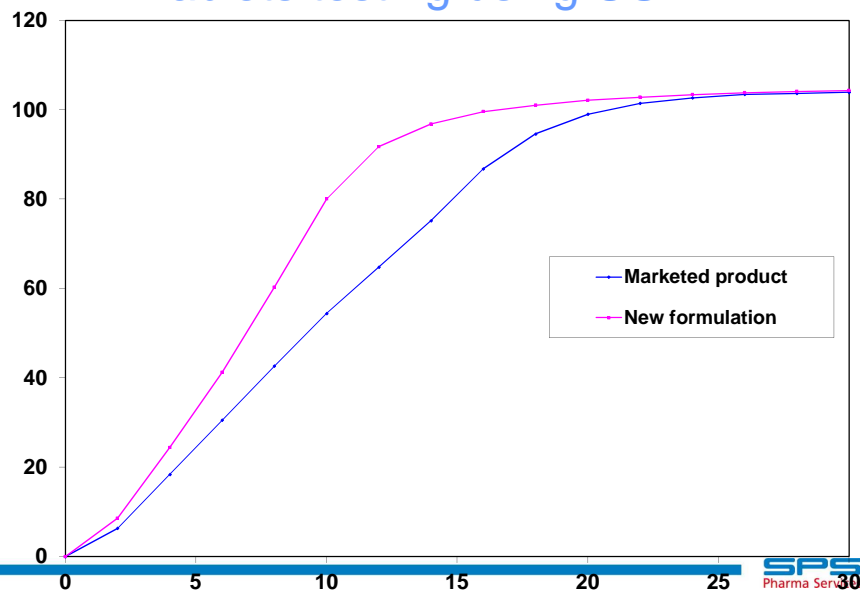

Formulation and process

Apply the USP4 flow through cell method to evaluate its discriminative ability...

- on the finished products (formulation)
- on samples taken at each process steps (process)

Conditions identical to previously except that the cell is adapted to the tested form (cells for tablet or powder).

Tablets testing using USP4

Background

The rank obtained is identical to the rank observed in vivo.

www.sps-pharma.com

SPS
Pharma Services

55

IR tablets case study

The flow through cell dissolution technique was able to show the difference seen in vivo with the same rank order. The USP4 dissolution method was used to support a reformulation of the product.

A new formulation was tested with both dissolution methods which showed it to be equivalent in vitro.

Even though there was no certainty about an IVIVC or IVIVR, using USP4 was a way to minimize the risk of bio in equivalence.

The BE study was repeated and concluded favorably.

The paddle method was maintained as QC method for the release of batches.

And the USP4 method was kept in house as a tool for R&D.

Outline

- Introduction about dissolution
- Dissolution tools
- API characterization
 - Intrinsic dissolution rate
 - Apparent dissolution
 - Case studies
- Conclusion

Take-home message

API biopharmaceutical characterization may be considered as time consuming but...

- In vitro testing is not expensive compared to in vivo studies.
- It can guide and facilitate formulation development.
- These are good tools to derisk biostudies.

Different approaches can be used:

- XRPD, DSC, particle morphology
- intrinsic / apparent dissolution
- evaluation of different dissolution methods than USP1&2
- use of different pHs/ media

Finally, development time can be shorten.

Lipophilic dosage forms

USP <2040>

2.9.42. DISSOLUTION TEST FOR LIPOPHILIC SOLID DOSAGE FORMS

APPARATUS

The apparatus (see Figure 2.9.42-1) consists of:

- A reservoir for the dissolution medium.
- A pump that forces the dissolution medium upwards through the flow-through cell.
- A flow-through cell shown in Figure 2.9.42-2 specifically intended for lipophilic solid dosage forms such as suppositories and soft capsules. It consists of 3 transparent parts which fit into each other. The lower part (1) is made up of 2 adjacent chambers connected to an overflow device.

Be science-driven...

- In October 2012 and April 2013, the US FDA issued new draft guidances related to fish oil-based soft gelatin capsules.
- The recommendation to get the approval for a generic formulation is either:
 - Clinical bioequivalence study or
 - In vitro USP4 profiles comparison (using the lipid cell)

Although, the Omega-3 capsules are classified as lipidic formulations, the use of the lipid cell was bringing to highly variable results.

62

Be science-driven...

- In October 2012 and April 2013, the US FDA issued new draft guidances related to fish oil-based soft gelatin capsules.
- The recommendation to get the approval for a generic formulation is either:
 - Clinical bioequivalence study or
 - In vitro USP4 profiles comparison (using the lipid cell)

Although, the Omega-3 capsules are classified as lipidic formulations, the use of the lipid cell was bringing to highly variable results.

Bringing a science-sounded justification, we demonstrated that the recommendation from FDA was not suitable and proposed an alternative as switching to a different cell than the recommended one addresses the issue of variability.

Injectable suspensions (2)

The authorities published clear statements requiring the use of the flow through cell for injectable suspensions such as:

- Betamethasone Acetate/Betamethasone Sodium Phosphate
- Leuprolide Acetate
- Methylprednisolone Acetate
- Risperidone
- Triamcinolone Acetonide
- Naltrexone
- Octreotide injection

" Develop a dissolution method using USP IV (Flow-Through Cell), and, if applicable, Apparatus II (Paddle) or any other appropriate method, for comparative evaluation by the Agency"
